Macrolides have been considered the drug of choice for group A streptococcal and pneumococcal infections when penicillin cannot be used. However, pneumococci with reduced penicillin sensitivity are often resistant to macrolides, and in some communities, up to 20% of S. pyogenes are macrolide-resistant. Because they are active against atypical respiratory pathogens, they are often used ...

The macrolides are a class of natural products that consist of a large macrocyclic lactone ring to which one or more deoxy sugars, usually cladinose and desosamine, may be attached.The lactone rings are usually 14-, 15-, or 16-membered. Macrolides belong to the polyketide class of natural products. Some macrolides have antibiotic or antifungal activity and are used as pharmaceutical drugs.

Macrolide - Wikipedia

Although UV absorption is the most commonly used detection system (Horie et al., 1998; Juhel-Gaugain et al., 1999; Leal et al., 2001), some macrolides lack a suitable chromophore group, and, therefore, electrochemical detectors (Kees et al., 1998) or fluorescence-based systems (Leroy et al., 1994) via pre-column derivatisation have been developed.

The apparent volume of distribution (V-) for clarithromycin following oral administration of a single 250- or 500-mg dose to healthy subjects is 226-266 liters [56]. This enables clarithromycin to concentrate at the site of infection, where its in vivo efficacy is enhanced.

Pharmacokinetics and Metabolism of Macrolides - ScienceDirect

Macrolides inhibit protein synthesis in bacteria by reversibly binding to the P site of the 50S unit of the ribosome. Macrolides mainly affect gram-positive cocci and intracellular pathogens such as mycoplasma, chlamydia, and legionella. Erythromycin was the first macrolide discovered; other macrolides include azithromycin, clarithromycin, and ...

Macrolide resistance may be intrinsic or plasmid-mediated and constitutive or inducible; it may develop rapidly (erythromycin) or slowly (tylosin) and generally results in cross-resistance between macrolides. Efflux from cells is a second important mechanism of resistance for some members of this class, as is, less frequently, drug inactivation.

The study by Peters et al (August 2011) demonstrating Mycoplasma pneumoniae community-acquired respiratory distress toxin in subjects with refractory asthma, provides a stronger rationale for use of macrolides in this setting, although it was not possible to eradicate this in all subjects. Could this toxin's presence and its sometimes failed eradication potentially explain the observed, yet ...
